Science is not a mere collection of facts. It is the correlation of facts, the interpretative synthesis of the available knowledge and its application that excite the imagination of a scientist. Even in these days of modern technology, the need for quick and accurate dissemination of new information and current concepts still exists. Conferences and Symposia offer one direct method of

communication. The Summer Schools are another approach. The success of a Summer School is mainly due to that human factor and understanding that goes with it and allows for extensive and often time-unrestricted discussions. During the course of the past 20 years, one of the most intensively studied groups of elements in the Periodic Table is the Lanthanides. In this period, we have increased our knowledge on these once exotic elements, which were once considered to be a part of a lean and hungry industry, many-fold due to the involvement of scientists from various disciplines. The purpose of our Summer School was to bring a group of experts and participants together for the exchange of ideas and information in an informal setting and to promote

interdisciplinary interactions. Out of many conceivable topics, we selected the following five as the main basis to broaden our knowledge and understanding 1) Systematics 2) Structure 3) Electronic and Magnetic Properties 4) Spectroscopic Properties and 5) Lanthanide Geochemistry.

A Problem-Solving Approach to Aquatic Chemistry Enables civil and environmental engineers to understand

the theory and application of aquatic equilibrium chemistry. The second edition of *A Problem-Solving Approach to Aquatic Chemistry* provides a detailed introduction to aquatic equilibrium chemistry, calculation methods for systems at equilibrium, applications of aquatic chemistry, and chemical kinetics. The text directly addresses two required ABET program outcomes in environmental engineering: "... chemistry (including stoichiometry, equilibrium, and kinetics)" and "material and energy balances, fate and transport of substances in and between air, water, and soil phases." The book is very student-centered, with each chapter beginning with an introduction and ending with a summary that reviews the chapter's main points. To aid in reader

comprehension, important terms are defined in context and key ideas are summarized. Many thought-provoking discussion questions, worked examples, and end of chapter problems are also included. Each part of the text begins with a case study, a portion of which is addressed in each subsequent chapter, illustrating the principles of that chapter. In addition, each chapter has an Historical Note exploring connections with the people and cultures connected to topics in the text. *A Problem-Solving Approach to Aquatic Chemistry* includes: Fundamental concepts, such as concentration units, thermodynamic basis of equilibrium, and manipulating equilibria. Solutions of chemical equilibrium problems, including setting up the problems and algebraic,

graphical, and computer solution techniques Acid-base equilibria, including the concepts of acids and bases, titrations, and alkalinity and acidity Complexation, including metals, ligands, equilibrium calculations with complexes, and applications of complexation chemistry Oxidation-reduction equilibria, including equilibrium calculations, graphical approaches, and applications Gas-liquid and solid-liquid equilibrium, with expanded coverage of the effects of global climate change Other topics, including chemical kinetics of aquatic systems, surface chemistry, and integrative case studies For advanced/senior undergraduates and first-year graduate students in environmental engineering courses, A

Problem-Solving Approach to Aquatic Chemistry serves as an invaluable learning resource on the topic, with a variety of helpful learning elements included throughout to ensure information retention and the ability to apply covered concepts in practical settings.

suggests that Lin Zexu, often called the first modern Chinese nationalist, popular icon for present-day prohibitionists, who legend says caused the first Opium War (1839-1842) by destroying some 20,000 chests of British opium, may deserve a second look from historians. His method of using lime and salt to "destroy" the opium simply shares too many parallels with European methods for extracting morphine from opium. Morphine salts were sold in both China and Europe in the 19th century as substitutes for opium or as opium "cures". Could the mandarin Lin Zexu have stolen from the British, conned the Americans, hastened the downfall of the parasitical Manchu dynasty, and manufactured a simple morphine salt? -- Graffii Milante, Valpaaiso, Chile --from book cover.
