The occurrence and spread of an animal health threat can be prevented when a timely assessment of the risk is carried out to inform prevention, response and control measures. These technical guidelines on rapid risk assessment (RRA) are designed as a simple and practical tool to be used by veterinary services to build risk assessment capacities and assist decision-makers in conducting qualitative RRA on the emergence, occurrence and/or spread of animal health threats. Using available evidence, data and information, a multidisciplinary team can conduct an RRA in a short time (within two weeks). The publication provides a simple and flexible methodology for conducting a RRA when facing a disease event. Eight steps in the RRA process are described and detailed examples are provided. The final outcomes of the RRA provide robust evidence and guidance for decision-makers in designing timely prevention, control and eradication measures that contribute to sustainable livelihoods, animal health, public health and enhanced food security.

The current COVID-19 pandemic has expanded lay people's vocabulary; PCR-testing is no longer mentioned only by virologists, nor are the terms basic reproduction ratio and herd-immunity limited to epidemiologists. This expansion of vocabulary that was previously only used in specialist settings already demonstrates global, societal impact. We have learnt that it is insufficient simply to act on disease emergence and spread. More focus is needed on prevention and surveillance of the precursors of emerging infectious disease, as well as early detection. To succeed in this, it is a necessity to collaborate across sectors – academics, governments, industry and the public – in a transdisciplinary way.
