The Governor's Dilemma develops a general theory of indirect governance based on the tradeoff between governor control and intermediary competence; the empirical chapters apply that theory to a diverse range of cases encompassing both international relations and comparative politics. The theoretical framework paper starts from the observation that virtually all governance is indirect, carried out through intermediaries. But governors in indirect governance relationships face a dilemma: competent intermediaries gain

power from the competencies they contribute, making them difficult to control, while efforts to control intermediary behavior limit important intermediary competencies, including expertise, credibility, and legitimacy. Thus, governors can obtain either high intermediary competence or strong control, but not both. This competence-control tradeoff is a common condition of indirect governance, whether governors are domestic or international, public or private, democratic or authoritarian; and whether governance addresses economic, security, or social issues. The empirical chapters analyze the operation and

implications of the governor's dilemma in cases involving the governance of violence (e.g., secret police, support for foreign rebel groups, private security companies), the governance of markets (e.g., the Euro crisis, capital markets, EU regulation, the G20), and cross-cutting governance issues (colonial empires, "Trump's Dilemma"). Competence-control theory helps explain many features of governance that other theories cannot: why indirect governance is not limited to principal-agent delegation, but takes multiple forms; why governors create seemingly counter-productive intermediary relationships; and why indirect governance is frequently unstable

over time.

This book covers ACS and Heart Failure, the chapters represent the most current, up to date and knowledgeable content on the topic available. It is written by the worlds most respected leaders in biomarkers, with a majority emphasis on what clinicians need to know. The Editors and their contributors have provided algorithms, annotated case discussions and caveats. They cover biomarkers to predict risk of heart disease, biomarkers of cardiorenal disease , and conclude with a section on new and emerging biomarkers.

It be genuinely helpful and practical to those in the field, including not just people working in the field, but nurses, doctors, etc who practice medicine in the clinic, the emergency department and the hospital.

With people aged 65 years and older currently making up the fastest growing age group throughout the world, the demographic revolution of an aging society will inevitably lead to increased pressure to develop a rationalistic and age-tailored process of diagnosis and treatment among the elderly. As aging people often suffer from several chronic diseases and are being treated with multiple medications concurrently, unwanted drug interactions occur more frequently. Whereas recent approaches have recommended to

remove particular drugs from the medication regimen to avoid adverse effects, Drug Therapy for the Elderly underlines both indispensable and dispensable elements of drug treatment in order to provide an overall assessment of drugs suitable for the aged. In view of the multimorbidity and polypharmacy situations experienced by elderly patients, this book takes into account the special needs and requirements shown by this group, thus serving as a timely reference for physicians who treat the elderly.

Now in its second edition, Standard Acupuncture

Nomenclature has been extensively revised following a number of consultations with experts representing all the major traditions of acupuncture. The nomenclature covers the 361 classical acupuncture points organized according to the fourteen meridians. Each entry gives the standardized name of the point in its three elements: an alphanumeric code derived from the English language translation of the meridian name the Chinese phonetic alphabet (Pinyin) name, and the Han (Chinese) character. The original form of the writing is shown first followed by a simplified form of the character. Each entry also provides a brief

comment on the point explaining the meaning of the Han character and the significance of the point's location.

Use of the nomenclature is facilitated by the inclusion of two indexes. The first lists the equivalent names and code names of the acupuncture points as used in English French Japanese Korean and Vietnamese. The second lists the Han characters for the 361 points.

Drug Therapy for the Elderly Cambridge University Press

This major reference work is the first comprehensive text to review in detail the data currently available on the epidemiology of the main rheumatic and musculoskeletal diseases. The problems

of disease definition and criteria are considered with data on the occurrence of these diseases, both prevalence and incidence, and their variation with age, sex, geographical area, ethnic group, and trends over time. The results of epidemiological investigations, looking at both genetic and environmental risk factors, are considered and the impact of specific diseases of survival is also considered. Covering 15 disease areas from inflammatory joint disease and connective tissue disease to degenerative joint disease and non articular conditions, such as low back pain and carpal tunnel syndrome, this is the only text available

which offers full coverage of the subject with a truly international perspective.

This manual takes a multidisciplinary approach to neurological disorders in the elderly.

Comprehensive and practical, it includes the most recent diagnostic criteria and immediately accessible visual care paths including the latest pharmacologic and non-pharmacologic interventions. Covering a range of modalities, from the importance and impact of each disease to diagnostic criteria, genetics, laboratory and imaging findings, treatment and care paths, this book focuses on neurological conditions that occur commonly in older persons or which have a striking effect on their lives. The common types of

dementias, Parkinson's disease and related disorders, rapidly progressive diseases, seizure disorders and multiple sclerosis are covered. Issues commonly affecting this population, such as neurobehavioral symptoms and caregiver issues, are discussed. Neuro-Geriatrics: A Clinical Manual is aimed at any physician who treats the elderly with neurological disorders: neurologists, geriatricians and geriatric psychiatrists, both specialists and general practitioners.

In the second edition of the book, the diversity of established and modern endoscopic therapeutic interventions is

systematically, comprehensively, and practically presented by experts in visceral surgery and gastroenterology. Numerous endoscopic images and schematic drawings illustrate the descriptions of therapeutic procedures. For each endoscopic procedure, the following is described: Indications Personnel, instrumental, and technical requirements Implementation Results Limitations, complications, and their management All contributions have been updated; a new chapter on hygiene measures has been added. Practical tips and references to alternative approaches appeal to both the young specialist and the experienced

endoscopist, as well as endoscopy professionals from other fields.

A variety of syndromes are hidden behind the term vertigo; the interdisciplinary approach here shows how surprisingly easy it is to correctly diagnose and effectively treat them. The book's clinical practicality uncovers the key elements necessary for understanding vertigo: the sensorimotor physiology, careful history-taking, and otoneurological examination. For each syndrome, there is a full description of the clinical features and

diagnostic procedure. Numerous tables and thorough cross-referencing guide you to differential diagnosis. Special emphasis is placed on the relationship between the management and the underlying pathological mechanism of the disease.

The chemical nanotechnology is one of the special areas of nanotechnology. By varying the composition, shape, size or character of the surface, these nanoparticles can be shaped time and again into small building blocks, resulting in unprecedented scopes for material design. At this moment in time, the developments in

the field of modern nanotechnology provide amazing success stories, such as the possibility for reconstructing surface structures for industrial materials that are demonstrated to us in nature. The reader will receive an overview of coatings systems based on the application of chemical nanotechnology. Practitioners will be given an introduction to nanostructured coatings and experts will find the account of various silanebased materials useful.

Preventing Decubitus Ulcers Springer  
This book provides a cutting-edge review of polyglutamine disorders. It primarily focuses on two main aspects: (1) the mechanisms underlying the

pathologies' development and progression, and (2) the therapeutic strategies that are currently being explored to stop or delay disease progression. Polyglutamine (polyQ) disorders are a group of inherited neurodegenerative diseases with a fatal outcome that are caused by an abnormal expansion of a coding trinucleotide repeat (CAG), which is then translated in an abnormal protein with an elongated glutamine tract (Q). To date, nine polyQ disorders have been identified and described: dentatorubral-pallidoluysian atrophy (DRPLA); Huntington's disease (HD); spinal-bulbar muscular

atrophy (SBMA); and six spinocerebellar ataxias (SCA 1, 2, 3, 6, 7, and 17). The genetic basis of polyQ disorders is well established and described, and despite important advances that have opened up the possibility of generating genetic models of the disease, the mechanisms that cause neuronal degeneration are still largely unknown and there is currently no treatment available for these disorders. Further, it is believed that the different polyQ may share some mechanisms and pathways contributing to neurodegeneration and disease progression. Kongreß World Health Organization Alcohol and nicotine addiction mostly occur

together. Over the last ten years therapeutic aspects and motivational strategies have been considerably improved. Hence, groups and subgroups have been defined and can be treated with specific medication and tailor-made psychotherapies, leading in the long term to considerably better and more effective results than the once broadly applied, rigorous abstinence-based therapies. However, alcohol and nicotine addiction still represent major medical and social problems. In this book, new therapeutic approaches are comprehensively described, outlining the different interactions between personality, environment and the effects of the

substance. In addition to prevention-based therapies and diagnosis, essential psychological and sociological strategies, as well as medication-based therapies, are also presented in detail. All of these therapies have realistic aims and are of global validity. In addition, the book provides a broad overview of the American and European epidemiology of alcohol and nicotine addictions. The book is written for all those who care for and offer professional therapy for alcohol and nicotine-addicted patients.

This second edition provides a comprehensive view of consolidated and

innovative concepts, in terms of both diagnosis and treatment. Written by leading international physicians and investigators, this book emphasizes the necessity of combining local and systemic treatments to achieve the objective of yielding higher cure rates and lower toxicities. Heavily updated from the previous edition, it highlights new surgery and radiotherapy techniques, disease awareness, patient quality of life, and comprehensive management. Head-and-neck cancers are a complex clinical entity and their response to treatment is also known to vary markedly in function of host-related factors. Notwithstanding the

impressive progresses observed in the field of imaging, head and neck cancers are often diagnosed at a late stage and the presence of locally advanced disease in a significant number of patients implies the use of aggressive treatments in order to both ensure local disease control and reduce distant metastasis risks. In comparison with the first edition, *Head and Neck Cancer, Second Edition* provides a detailed update of innovative concepts in chemo- and bio-radiation, viral infection impact on tumor growth and response to treatment, and impact of tumor- and host-related factors on treatment outcome.
