Fundamentals of Oral

Anatomy, Physiology and Histology comprises of four units:

Oral Histology, Oral Anatomy, General Embryology and Oral Physiology sections

elaborating essential concepts in altogether 38 chapters. Oral Histology emphasizes

on the morphology and variation of teeth as a part of dental anatomy. The dental histology section

describes the development of teeth and associated

tissues including enamel, dentin, pulp, cementum and periodontal ligament. Salivary glands, oral mucosa, maxillary sinus, temporomandibular joint and tissue preparation comprise the rest of the second unit, Oral Anatomy. The third unit of Embryology explains the development of the oral and paraoral structures with details of general embryology from

<p>fertilization onwards. Physiology is the fourth unit which constitutes important topics related to year one of dentistry that include mastication, chewing cycle, saliva and calcium phosphorous metabolism. - Conforms to the syllabi prescribed by DCI - Offers an easy-to-follow format for each chapter with numerous tables, flowcharts, photos, and simple neatly labelled line diagrams and</p>	<p>histomicrographs - Summarizes important take away points under Synopsis in each chapter - Provided Review Questions in each chapter for self-appraisal - Hand drawn histology diagrams <u>Oral Development and Histology</u> St. Louis ; Toronto : Mosby This work is designed to familiarise dental students and professionals with knowledge in the fields of</p>	<p>oral histology and embryology and to relate these disciplines to clinical dental hygiene and day-to-day dental practice. clear, accessible style, it provides dental nurses, hygienists, therapists and clinical dental technicians with essential grounding in the head and neck area, as well as all the body systems that have implications for the DCP when things go wrong. Beginning with a definition of anatomy and physiology, and with all the basics of cell, tissue and organ biology, this Basic Guide covers: the

cardiovascular, respiratory and digestive systems, all of which are central to the DCP curriculum core areas such as skull and oral anatomy, periodontal tissues, blood and nerve supply to the oral cavity, muscles of mastication, and major salivary glands areas such as jaw and tooth development, and the histology of oral and dental tissue. Each area is covered separately

and in depth, giving the reader an understanding of their structure and function in health as well as illnesses relevant to medical emergencies and dental-related disorders (such as acid reflux which causes tooth erosion).
