The Tests of Life W. W. Norton & Company

A number of psychologists have begun to apply principles from evolutionary biology to their domains in an attempt to provide an integrated model of human behaviour. One such application, a theory based on the r/K continuum of reproductive strategies, postulates that a single heritable reproductive dimension underlies a broad range of individual differences in life histories, physiological functioning, and social behaviour (Rushton, 1985). The two experiments reported here provide a test of this theory. Experiment 1 was conducted to determine if such a reproductive dimension exists and the extent of its heritability. Numerous reproductive and other variables from a sample of 7620 twins were subjected to principal component analyses. The obtained solutions for both male and female twins revealed factors which resembled the proposed dimension. Comparisons of aggregated standard scores for monozygotic twin pairs and same-sexed dizygotic pairs indicated that the dimension was moderately heritable. The second experiment replicated and extended the first study using a broader range of variables from a sample of 250 university undergraduates. In both experiments, strongest support for the theory was found for the physiological and sexual-reproductive variables, with the findings for personality variables being less supportive. The results were generally interpreted as providing initial support for the application of r/K theory to humans.

The Origin and Nature of Life on Earth Cambridge University Press

This edition of Science and Creationism summarizes key aspects of several of the most important lines of evidence supporting evolution. It describes some of the positions taken by advocates of creation science and presents an analysis of these claims. This document lays out for a broader audience the case against presenting religious concepts in science classes. The document covers the origin of the universe, Earth, and life; evidence supporting biological evolution; and human evolution. (Contains 31 references.) (CCM)

A central goal of life history theory is to understand the selective factors that generate the diversity of reproductive patterns observed in nature. Within lifetime changes in reproductive investment will determine an organism's fitness; however, this area of life history theory has received less attention than comparisons among population that characterize life history traits as a single population mean. Reproductive allocation can be affected by multiple cues; the integration of these cues across an organism's lifetime generates the diversity in life history strategies observed in nature. Life history studies should examine the interacting effects of multiple cues on life history strategies to generate better predictions and generalizations of age-related changes in reproductive investment. An individual's life history strategy is inherently multivariate consisting of a coordinated suite of life history traits that, when combined across the organism's lifetime, determines its fitness. Life history strategies can therefore be described as a trajectory through multivariate space defined by life history traits. Here I describe life history trajectory analysis, a multivariate analytical approach for quantifying and comparing phenotypic change in life history strategies; this methodology is adapted from an analytical framework originally described for studies of morphological evolution. Life history trajectories have attributes (magnitude, direction, and shape) that can be quantified and statistically compared among taxa to determine if life history patterns are predictable. Using the life history trajectory analysis, I demonstrate the effect of prior experience on reproductive allocation in the burying beetle *Nicrophorus orbicollis*. The effect of prior experience resulted in a terminal investment or accentuated response to age-based cues, or resulted in a conservative investment strategy or reproductive restraint. In the livebearing fish *Gambusia affinis*, females adjust the level of reproductive investment to current reproduction based on age- or environment-based cues. Age-0 females decreased the level of reproductive investment to current reproduction in late summer prior to the onset of fall and winter months. Old females, on the other hand, increased the level of reproductive investment as the summer progressed. The reproductive restraint and terminal investment patterns exhibited by age-0 and age-1 females, respectively, were consistent with the predictions from the cost of reproduction hypothesis. These studies demonstrate how the life history trajectory analysis provides an analytical tool to test predictions of life history theory. Additionally, I provide evidence that organisms use multiple cues to determine the level of reproductive investment and that the strength of the effect of each cue will depend on the age of an individual.

Molecular Biology of the Cell Academic Press

The History of Alternative Test Methods in Toxicology uses a chronological approach to demonstrate how the use of alternative methods has evolved from their conception as adjuncts to traditional animal toxicity tests to replacements for them. This volume in the History of Toxicology and Environmental Health series explores the history of alternative test development, validation, and use, with an emphasis on humanity and good science, in line with the Three Rs (Replacement, Reduction, Refinement) concept expounded by William Russell and Rex Burch in 1959 in their now classic volume, *The Principles of Humane Experimental Technique*. The book describes the historical development of technologies that have influenced the application of alternatives in toxicology and safety testing. These range from single cell monocultures to sophisticated, miniaturised and microfluidic organism-on-a-chip devices, and also include molecular modelling, chemoinformatics and QSAR analysis, and the use of stem cells, tissue engineering and hollow fibre bioreactors. This has been facilitated by the wider availability of human tissues, advances in tissue culture, analytical and diagnostic methods, increases in computational processing, capabilities, and a greater understanding of cell biology and molecular mechanisms of toxicity. These technological developments have enhanced the range and information content of the toxicity endpoints detected, and therefore the relevance of test systems and data interpretation, while new techniques for non-invasive diagnostic imaging and high resolution detection methods have permitted an increased role for human studies. Several key examples of how these technologies are being harnessed to meet 21st century safety assessment challenges are provided, including their deployment in integrated testing schemes in conjunction with kinetic modelling, and in specialised areas, such as inhalation toxicity studies. Cracking the AP U. S. History Exam, 2017 Edition Simon and Schuster

Human beings may share 98 percent of their genetic makeup with their nonhuman primate cousins, but they have distinctive life histories. When and why did these uniquely human patterns evolve? To answer that question, this volume brings together specialists in hunter-gatherer behavioral ecology and demography, human growth, development, and nutrition, paleodemography, human paleontology, primatology, and the genomics of aging. The contributors identify and explain the peculiar features of human life histories, such as the rate and timing of processes that directly influence survival and reproduction. Drawing on new evidence from paleoanthropology, they question existing arguments that link human's extended childhood dependency and long 'post-reproductive' lives to brain development, learning, and distinctively human social structures. The

volume reviews alternative explanations for the distinctiveness of human life history and incorporates multiple lines of evidence in order to test them.

Wonderful Life: The Burgess Shale and the Nature of History For Dummies

Excerpt from *The Tests of Life: A Study of the First Epistle of St. John*; Being the Kerr Lectures for 1909 AS only a portion of the contents of this volume could be orally delivered, I have not thought it necessary to adhere to either the form or the title of Lecture, but (with the consent of the Trustees) have assigned a separate Chapter to each principal topic dealt with. The method adopted in this exposition of the Epistle - that, namely, of grouping together the passages bearing upon a common theme - will be found, I trust, to have advantages which compensate in some measure for its disadvantages. That it has disadvantages, as compared with a continuous exposition, I am well aware. These, however, I have endeavoured to minimise, by supplying in the first chapter a specially full analysis of the Epistle, by careful indexing, and by making liberal use of cross-references. For the convenience of the reader, I have set down in the footnotes such exegetical details as seemed most necessary to explain or to establish the interpretation adopted; but where these involved lengthy or intricate discussion, they, along with all minutest points of exegesis, have been relegated to the Notes at the end of the volume. In these Notes the text of the Epistle is continuously followed. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. "[An] extraordinary book. . . . Mr. Gould is an exceptional combination of scientist and science writer. . . . He is thus exceptionally well placed to tell these stories, and he tells them with fervor and

intelligence."—James Gleick, New York Times Book Review High in the Canadian Rockies is a small limestone quarry formed 530 million years ago called the Burgess Shale. It hold the remains of an ancient sea where dozens of strange creatures lived—a forgotten corner of evolution preserved in awesome detail. In this book Stephen Jay Gould explores what the Burgess Shale tells us about evolution and the nature of history.
