A Sourcebook for Mental Health Measures, Incorporating the Final Report on "A

Taxonomy of Data-collecting Devices" European Alliance for Innovation

Variability in predispositions for language learning has attracted scholarly curiosity for over 100 years. Despite major changes in theoretical explanations and foreign/second language teaching paradigms, some patterns of associations between predispositions and learning outcomes seem timelessly robust. This book discusses evidence from a research project investigating individual differences in a wide variety of domains, ranging from language aptitude over general cognitive abilities to motivational and other affective and social constructs. The focus lies on young learners aged 10 to 12, a less frequently investigated age in aptitude research. The data stem from two samples of multilingual learners in German-speaking Switzerland. The target languages are French and English. The chapters of the book offer two complementary perspectives on the topic: On the one hand, cross-sectional investigations of the underlying structure of these individual differences and their association with the target languages are discussed. Drawing on factor analytical and multivariable analyses, the different components are scrutinized with respect to their mutual dependence and their relative impact on target language skills. The analyses also take into

account contextual factors such as the learners' family background and differences across the two contexts investigated. On the other hand, the potential to predict learner's skills in the target language over time based on the many different indicators is investigated using machine learning algorithms. The results provide new insights into the stability of the individual dispositions, on the impact of contextual variables, and on empirically robust dimensions within the array of variables tested.

The Importance of Learning Styles ARTI-ARCH

This work was created to help researchers in the mental health field to access mental health measures that were previously mainly inaccessible, and to help reduce the costs of duplicative efforts to create mental health measures that had already been created.

The First Sourcebook on Asian Research in Mathematics Education - 2 Volumes

Routledge

Mathematics and Science education have both grown in fertile directions in different geographic regions. Yet, the mainstream discourse in international handbooks does not lend voice to

developments in cognition, curriculum, teacher development, assessment, policy and implementation of mathematics and science in many countries. Paradoxically, in spite of advances in information technology and the “flat earth” syndrome, old distinctions and biases between different groups of researcher’s persist. In addition limited accessibility to conferences and journals also contribute to this problem. The International Sourcebooks in Mathematics and Science Education focus on under-represented regions of the world and provides a platform for researchers to showcase their research and development in areas within mathematics and science education. The First Sourcebook on Asian Research in Mathematics Education: China, Korea, Singapore, Japan, Malaysia and India provides the first synthesized treatment of mathematics education that has both developed and is now prominently emerging in the Asian and South Asian world. The book is organized in sections coordinated by leaders in mathematics education in these countries and editorial teams for each country affiliated with them. The purpose of unique sourcebook is to both consolidate and survey the established body of research in these countries with findings that have influenced ongoing research agendas and informed practices in Europe, North America (and other countries) in addition to serving as a platform to showcase existing research that has shaped teacher education, curricula and policy in these Asian countries. The book will serve as a standard reference for mathematics education researchers, policy makers, practitioners and students both in and outside Asia, and complement the Nordic and NCTM perspectives.

This volume brings together theory, research and development in cognitive neuro-science. It investigates the neural processes involved in cognition and learning, using developments in computer technology to study the brain in action and other topographic brain mapping. Electrical activity patterns of the brain in the learning processes are displayed through these techniques. Part 1 delineates neuroscience application to educational perspectives. Part 2 reports on emotional and learning disorders, such as autism, while Part 3 applies cognitive science to educational and mental health, as well as to settings such as the classroom, rehabilitation centre or doctor’s office. *Journal of Social and Behavioral Sciences* John Wiley & Sons

The aim of this book is to explore measures of mathematics knowledge, spanning K-16 grade levels. By focusing solely on mathematics content, such as knowledge of mathematical practices, knowledge of ratio and proportions, and knowledge of abstract algebra, this volume offers detailed discussions of specific instruments and tools meant for measuring student learning. Written for assessment scholars and students both in mathematics education and across educational contexts, this book presents innovative research and perspectives on quantitative measures, including their associated purpose statements and validity arguments.

The Effects of Video Games on Children IGI Global

Written for teachers, trainers, and instructional designers -- anyone who is responsible for designing or preparing instruction -- this book begins with one basic premise: individual differences mediate learning at all levels and in all situations. That is, some learners find it easier or more difficult to learn some skills or to learn from certain forms of instruction because they vary in terms of aptitude, cognitive styles, personality, or learning styles. This volume describes most of the major differences in a readable and accessible way and demonstrates how to design various forms of instruction and predict the ease with which learners will acquire different skills. Most books that discuss any learner differences focus on those that characterize special education populations, whereas this book focuses on normal learners. Designed as a handbook, this volume is structured to provide easy and consistent access to information and answers, and prescriptions and hypotheses. When definitive answers are not possible because there is no research documentation, the authors suggest theories designed to stimulate future research.

The rapid growth in popularity of computer and video games, particularly among children and teenagers, has given rise to public concern about the effects they might have on youngsters. The violent themes of many of these games, coupled with their interactive nature, have led to accusations that they may be worse than televised violence in affecting children’s antisocial behaviour. Other allegations are that they have an addictive quality and that excessive playing results in a diminished social contact and poorer school performance. But how bad are video games? There are strong methodological reasons for not accepting the evidence for video games effects at face value. There are also positive signs that playing these games can enhance particular mental competencies in children. This book provides an up-to-date review and critique of research evidence from around the world in an attempt to put the issue of video game effects into perspective.

The Addiction-Prone Personality University of Toronto Press

This book investigates the impact of culture-based learning among secondary school children in India. The bias of cultural values can determine a student’s learning preference. This study reflects that students have the potential to adapt and develop their learning styles according to society, family, religion, and cultural demands. While traditional values are against certain types of students, there is still hope for strategic change by stimulating educators to transform the way students should be allowed to learn.

This monograph provides a comprehensive research review of intelligent techniques for personalisation of e-learning systems. Special emphasis is given to intelligent tutoring systems as a particular class of e-learning systems, which support and improve the learning and teaching of domain-specific knowledge. A new approach to perform effective personalization based on Semantic web technologies achieved in a tutoring system is presented. This approach incorporates a recommender system based on collaborative tagging techniques that adapts to the interests and level of students’ knowledge. These innovations are important contributions of this monograph. Theoretical models and techniques are illustrated on a real personalised tutoring system for teaching Java programming language. The monograph is directed to, students and researchers interested in the e-learning and personalization techniques.

International Perspectives on Individual Differences Routledge

Learning is an inseparable part of human experience. Understanding how adults learn and applying that expertise to practical everyday situations and relationships opens the window on a broader understanding of the capacity of the human mind. Dorothy MacKeracher’s *Making Sense of Adult Learning* was first published in 1996, and was acclaimed for its readability and value as a reference tool. For the second edition of this essential work, MacKeracher has reorganized and revised many of the chapters to bring the text up-to-date for contemporary use. Concepts are presented from learning-centred and learner-centred perspectives, while related learning and teaching principles provide ideas about how one may enable others to learn more effectively. Written for people preparing to become adult educators, *Making Sense of Adult Learning* provides background information about the nature of adult learning and the characteristics that typify adult learners. This new edition will be quick to assert its place as the premier guide in the field.

Social Computing: Concepts, Methodologies, Tools, and Applications European Alliance for Innovation

This book provides a timely review of learning style research. It examines those approaches that purport to promote effective learning. It affirms the need for instructors and trainers to recognize the importance of individual learning differences and to use methods that help create a learning climate which increases the potential learning for all students or trainees regardless of their preferred way of learning. The ability to understand and to teach to the various learning styles of students is essential to improving the effectiveness of college-level education. In this book, Sims and Sims bring together significant research to aid academics and organizational trainers in understanding and applying learning style research and knowledge to program, course, and class development.
