Vegetable gardens

Protects fruit and vegetable gardens

Use indoors or out

Lasts up to 4 weeks

Non-toxic

Odorless

THIS PACKAGE CONTAINS:

1 Dual action Lure

3 Disposable traps

Intercept Stink Bugs

Before they enter your home

Guaranteed to work or your money back

Named for the unpleasant odor that is released when they are squashed, stink bugs have become a major pest in most states, and they continue to expand their range. In gardens, stink bugs can damage plants such as roses, vegetables, ornamental plants and trees, but the most common concern that homeowners have about this insect comes when it invades their home. Typically, the insects fly onto the exterior of homes and businesses when the weather starts to cool around mid to late September or early October. Once active, these dime-sized pests begin to seek cracks and crevices to enter buildings to over winter. Common entry points for these smelly pests include small cracks in screens, installing weather stripping and door sweeps, and using caulk to seal any cracks around the building can help keep these pests out.

Exclusion is the best preventative step that homeowners can take and this stink bug trap can play a pivotal role. To first collapse large population of existing infestations, applications of Bonide Beetle Killer or Eight Insect Control outdoors, and Household Insect Control indoors, may be necessary.

How does the stink bug trap work?

Bonide Bug Beater Stink Bug Traps use pheromone technology to safely lure Brown Marmorated Stink Bugs and the Green Stink Bug from around your home, garden, fruit trees, and landscape plants. Once they land on our super tacky glue panels they are stuck. Just remove the backing from the sticky side of the trap. Remove the lure from its pouch and place on the trap. When assembled, your trap should look like this:

Hang or attach the trap from any convenient spot. Once you catch several Stink Bugs they will produce enough aggregate pheromone to draw more. Our lure is a different pheromone so the combination of the two will produce a much stronger attraction. During the warm months the traps will also capture the Stink Bugs that have flown or crawled into the home.

How long does the lure last?

Our lure will last up to 4 weeks. It is in a controlled release dispenser that allows the pheromone to dispense steadily over a 28 day period.

From how far will the lure attract?

The lure will attract up to a distance of 50 feet. This is determined by temperature, wind direction and population density.

How many stink bug traps do I need?

The lure will attract up to a distance of 50 feet. For the average size home, we recommend that you place one in your front yard and one in your backyard. More may be needed if you have a large yard, live near a wooded area or orchards, grow vegetables, etc. A total of 8-10 live Stink Bug traps are suggested per acre. A live trap is one with the lure.

When is the best time to use the traps?

The trap can be used year round, however Stink Bugs are generally only eating, mating and laying eggs outside during late spring, summer, and early fall. This is late May through the end of October when outside temperatures remain above 60°F and their food sources are abundant.

What are the best outside spots to put the trap?

Place the trap outside, at least 10 feet from your biggest problem areas. This would include gardens, fruit trees and landscape plants. We recommend that the trap be placed on a fence, deck or patio and not anything that might be consumed by Stink Bugs.

Will the trap work in my house?

A qualified "Yes". Our lure only draws the Stink Bug. It does not have an offensive odor so you can use it inside from late May to early October to capture the bugs that get into your home. As temperatures drop during late fall, stink bugs will not be attracted to the lure anymore as they are just looking for a warm place to overwinter. By the next spring the cycle of the Stink Bugs will start again. The placement of the trap near a light source makes it more effective when used indoors.

The bug

An unpleasant odor that is released when they are squashed, stink bugs have become a major pest in most states, and they continue to expand their range in gardens, fields and orchards as warmer weather and prolonged dry conditions extend their range. The opposite of being welcomed, stink bugs are a pest that infest yards and gardens, damaging fruits and vegetables, indoors and out. They love to eat the flowers, fruit and vegetables in your home and businesses when the weather starts to cool around late September or early October. Now active, these盾-waved pests begin to seek shelter and carry on their essential activities in order to survive winter. Common entry points for these stink bugs include cracks and crevices in doors, windows, and siding, and in the plastic around air conditioning units, chimneys, and attic vents. The easiest way to keep stink bugs from entering your home is to seal any cracks and crevices with caulk, put screens in windows and doors, and use good-quality weather stripping and door sweeps.

Stink bugs are distinguished from other insects by the unpleasant odor that is released when they are squashed. This distinctive and strong odor can sometimes be found on items that have been in contact with stink bugs, and it can become a nuisance if the bugs enter your home. Preventing stink bugs from entering your home is the best way to control this pest.

**HOW DOES THE STINK BUG TRAP WORK?**

Bonide® Bug Beater® Stink Bug Traps use pheromone technology to safely lure Brown Marmorated Stink Bugs and the Green Stink Bug from your home, garden, flower beds, and landscape plants. Once they land on the super catching glue panel the pheromone is absorbed. Just remove the trap, throw out the trapped bug panel and stick the lure on another sticky trap and place the new trap in the same trapping area.

The best trapping results will be seen in late spring, all summer and early fall when daytime temperatures are warm and food supplies like fruits, vegetables and flowers are abundant. After conditions change, top performance will decline. There is no exact date for the start of the trapping season. It will begin in southern areas and move north with the general warming of temperatures.

**HOW TO USE THE STINK BUG TRAP**

Hang or attach the trap near any convenient spot. Once you have trapped Stink Bugs they will produce enough aggregate pheromone to draw more. For best results, place the trap approximately 4 to 5 feet above the ground and at least 10 feet from your garden, fruit trees and other landscape plants. Remove the backing from the sticky side of the trap. Remove the lure from its pouch and place it on the trap. When assembled, your trap should look like this:

Hang or attach the trap from any convenient spot. Once you have trapped Stink Bugs they will produce enough aggregate pheromone to draw more.
